data-science-world

This is meant to be a showcase of stuff I'm playing around with, struggling with or obsessing about.

Its arranged as follows : 1. Entire projects are in the **Projects** folder. My attempt here is to try to answer as many questions as I can. Ideally it would try spanning the entire data science pipeline, from data to data product. These folders include * Data stories (in the README.mds) * Data analyses * Machine Learning Prediction algorithms * Dashboards * the data used for all these analyses (unless its sensitive data) 2. One-off analyses usually demonstrating a quick demo of a library, technique or concept. * If the goal of the notebook is to explain a technique, then the choice of data is deliberately simple (for e.g. iris, cars). I feel this prevents focus on the data and enables the reader to focus on the technique.

* Some are complete, some . . . meh!

Important notes in red.

TODOs in green. Ill revisit whenever I can.

Please remember that most of the projects are work in progress(w.i.p) unless specified so..**because a data science project never ends** (err. . . .also I work on these during off hours and when Im not day dreaming.)
